### 1 Basic

### 1.1 Compiler Shell

```
if [ $# -ne 2 ] ; then
   g++ -std=c++17 -DABS -Wall -Wextra -Wshadow $1.cpp -o
        $1
else
   g++ -std=c++17 -DABS -Wall -Wextra -Wshadow $1.cpp -o
        $1 -fsanitize=address
fi
   ./$1
chmod +x ./run.sh
./run.sh main [1]
```

#### 1.2 Default Code

```
#include <bits/stdc++.h>
using namespace std;
#define ll long long
#define pb push_back
#define all(x) x.begin(), x.end()
```

#### 1.3 Testing Todo List

```
0. choose editor
1. shell script
2. __int128, __lg, __builtin_popcount
3. judge speed v.s.local speed
4. CE penalty?
```

#### 1.4 Debug Macro

#### 1.5 Stress Test Shell

```
g++ $1.cpp -o $1
g++ $2.cpp -o $2
g++ $3.cpp -o $3
for i in {1..100}; do
  ./$3 > input.txt
  # st=$(date +%s%N)
  ./$1 < input.txt > output1.txt
  # echo "$((($(date +%s%N) - $st)/1000000))ms"
  ./$2 < input.txt > output2.txt
  if cmp --silent -- "output1.txt" "output2.txt"; then
    continue
  fi
  echo Input:
  cat input.txt
  echo Your Output:
  cat output1.txt
  echo Correct Output:
  cat output2.txt
  break
done
echo OK!
./stress.sh main good gen
```

#### 1.6 Pragma

```
#pragma GCC optimize("Ofast,inline,unroll-loops")
#pragma GCC target("bmi,bmi2,lzcnt,popcnt,avx2")
```

#### 1.7 Fast IO

```
#include<unistd.h>
char OB[65536]; int OP;
inline char RC() {
    static char buf[65536], *p = buf, *q = buf;
    return p == q && (q = (p = buf) + read(0, buf, 65536)
        ) == buf ? -1 : *p++;
}
inline int R() {
    static char c;
```

```
while((c = RC()) < '0'); int a = c ^ '0';
while((c = RC()) >= '0') a *= 10, a += c ^ '0';
return a;
}
inline void W(int n) {
    static char buf[12], p;
    if (n == 0) OB[OP++]='0'; p = 0;
    while (n) buf[p++] = '0' + (n % 10), n /= 10;
    for (--p; p >= 0; --p) OB[OP++] = buf[p];
    if (OP > 65520) write(1, OB, OP), OP = 0;
}
```

### 2 Data Structure

#### 2.1 Leftist Tree

```
struct node {
         11 rk, data, sz, sum;
node *1, *r;
           node(ll \ k) : rk(0), data(k), sz(1), l(0), r(0), sum(k)
                               ) {}
11 sz(node *p) { return p ? p->sz : 0; }
11 rk(node *p) { return p ? p->rk : -1; }
11 sum(node *p) { return p ? p->sum : 0; }
node *merge(node *a, node *b) {
         if (!a || !b) return a ? a : b;
        if (a->data < b->data) swap(a, b);
         a->r = merge(a->r, b);

#### 3.8 Flow Model

- Maximum/Minimum flow with lower bound / Circulation problem
  - 1. Construct super source S and sink T.
  - 2. For each edge (x,y,l,u), connect  $x \to y$  with capacity u-l.
  - 3. For each vertex v, denote by in(v) the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
  - 4. If in(v)>0, connect  $S\to v$  with capacity in(v), otherwise, connect  $v \to T$  with capacity -in(v).
    - To maximize, connect t o s with capacity  $\infty$  (skip this in circulation problem), and let f be the maximum flow from S to T. If  $f \neq \sum_{v \in V, in(v) > 0} in(v)$ , there's no solution. Otherwise, the maximum flow from s to t is the answer
    - To minimize, let f be the maximum flow from S to T. Connect  $t \to s$  with capacity  $\infty$  and let the flow from S to T be f'. If  $f+f' \neq \sum_{v \in V, in(v)>0} in(v)$ , there's no solution. Otherwise, f' is the answer.
  - 5. The solution of each edge e is  $l_e+f_e$ , where  $f_e$  corresponds to the flow of edge  $\boldsymbol{e}$  on the graph.

- ullet Construct minimum vertex cover from maximum matching M on bipartite graph (X, Y)
  - 1. Redirect every edge:  $y\to x$  if  $(x,y)\in M$  ,  $x\to y$  otherwise. 2. DFS from unmatched vertices in X .

  - 3.  $x \in X$  is chosen iff x is unvisited.
  - 4.  $y \in Y$  is chosen iff y is visited.
- Maximum density induced subgraph
  - 1. Binary search on answer, suppose we're checking answer  ${\it T}$
  - 2. Construct a max flow model, let  ${\cal K}$  be the sum of all weights
  - 3. Connect source  $s \to v$  ,  $v \in G$  with capacity K 4. For each edge (u,v,w) in G , connect  $u \to v$  and  $v \to u$  with
  - For  $v \in G$ , connect it with sink  $v \to t$  with capacity  $K+2T-(\sum_{e \in E(v)} w(e)) 2w(v)$
  - 6. T is a valid answer if the maximum flow f < K|V|
- Minimum weight edge cover

capacity w

- 1. For each  $v \in V$  create a copy v', and connect  $u' \to v'$  with
- weight w(u,v). 2. Connect  $v \to v'$  with weight  $2\mu(v)$ , where  $\mu(v)$  is the cost of the cheapest edge incident to v.
- 3. Find the minimum weight perfect matching on  $G^{\prime}$ .
- Project selection problem
  - 1. If  $p_v>0$ , create edge (s,v) with capacity  $p_v$ ; otherwise, create edge (v,t) with capacity  $-p_v$
  - Create edge (u, v) with capacity w with w being the cost of choosing u without choosing v.
     The mincut is equivalent to the maximum profit of a subset
  - of projects.
- 0/1 quadratic programming

$$\sum_{x} c_{x} x + \sum_{y} c_{y} \bar{y} + \sum_{xy} c_{xy} x \bar{y} + \sum_{xyx'y'} c_{xyx'y'} (x \bar{y} + x' \bar{y'})$$

can be minimized by the mincut of the following graph:

- 1. Create edge (x,t) with capacity  $c_x$  and create edge (s,y) with capacity  $c_y\,.$
- 2. Create edge (x,y) with capacity  $c_{xy}$ . 3. Create edge (x,y) and edge (x',y') with capacity  $c_{xyx'y'}$ .

## Graph

#### 4.1 Heavy-Light Decomposition

```
vector<int> dep, pa, sz, ch, hd, id;
int _id;
void dfs(int i, int p) {
  dep[i] = ~p ? dep[p] + 1 : 0;
  pa[i] = p, sz[i] = 1, ch[i] = -1;
  for (int j : g[i])

};
```

### Linear Programming Construction

Standard form: maximize  $\mathbf{c}^T\mathbf{x}$  subject to  $A\mathbf{x} \leq \mathbf{b}$  and  $\mathbf{x} \geq 0$ . Dual LP: minimize  $\mathbf{b}^T\mathbf{y}$  subject to  $A^T\mathbf{y} \geq \mathbf{c}$  and  $\mathbf{y} \geq 0$ .  $\bar{\mathbf{x}}$  and  $\bar{\mathbf{y}}$  are optimal if and only if for all  $i \in [1,n]$ , either  $\bar{x}_i = 0$  or  $\sum_{j=1}^m A_{ji}\bar{y}_j = c_i$  holds and for all  $i \in [1,m]$  either  $\bar{y}_i = 0$  or  $\sum_{j=1}^{n} A_{ij} \bar{x}_j = b_j$  holds.

- 1. In case of minimization, let  $c_i^\prime = -c_i$
- 2.  $\sum_{1 \leq i \leq n} A_{ji} x_i \geq b_j \rightarrow \sum_{1 \leq i \leq n} A_{ji} x_i \leq -b_j$
- 3.  $\sum_{1 \leq i \leq n} A_{ji} x_i = b_j$ 
  - $\sum_{\substack{1 \le i \le n \\ \sum_{1 \le i \le n}}} A_{ji} x_i \le b_j$
- 4. If  $x_i$  has no lower bound, replace  $x_i$  with  $x_i x_i^\prime$

#### 6.9 Theorem

• Kirchhoff's Theorem

Denote L be a  $n \times n$  matrix as the Laplacian matrix of graph Gwhere  $L_{ii}=d(i)$ ,  $L_{ij}=-c$  where c is the number of edge (i,j) in

– The number of undirected spanning in G is  $|\det(\tilde{L}_{11})|$ .

- The number of directed spanning tree rooted at r in G is  $|\det(L_{rr})|$ .
- Tutte's Matrix

Let D be a n imes n matrix, where  $d_{ij} = x_{ij}$  ( $x_{ij}$  is chosen uniformly at random) if i < j and  $(i,j) \in E$ , otherwise  $d_{ij} = -d_{ji}$ .  $\frac{rank(D)}{2}$ is the maximum matching on  $\widehat{G}$ .

- Cayley's Formula
  - Given a degree sequence  $d_1, d_2, \ldots, d_n$  for each labeled vertices, there are

$$\frac{(n-2)!}{(d_1-1)!(d_2-1)!\cdots(d_n-1)!}$$

spanning trees.

- Let  $T_{n,k}$  be the number of *Labeled* forests on n vertices with k components, such that vertex  $1,2,\ldots,k$  belong to different components. Then  $T_{n,k}=kn^{n-k}-1$ .
- Erdős-Gallai Theorem

A sequence of non-negative integers  $d_1 \geq d_2 \geq \ldots \geq d_n$  can be represented as the degree sequence of a finite simple graph on nvertices if and only if  $d_1+d_2+\ldots+d_n$  is even and

$$\sum_{i=1}^k d_i \le k(k-1) + \sum_{i=k+1}^n \min(d_i, k)$$

holds for all  $1 \leq k \leq n$ .

• Burnside's Lemma

Let X be a set and G be a group that acts on X. For  $g \in G$ , denote by  $X^g$  the elements fixed by g:

$$X^g = \{ x \in X \mid gx \in X \}$$

Then

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|.$$

Gale-Ryser theorem

A pair of sequences of nonnegative integers  $a_1 \geq \cdots \geq a_n$  and  $b_1,\ldots,b_n$  is bigraphic if and only if  $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$  and  $\sum_{i=1}^k a_i \le$  $\sum \mathsf{min}(b_i,k)$  holds for every  $1 \leq k \leq n$ .

• Fulkerson-Chen-Anstee theorem

A sequence  $(a_1,b_1),\ldots,(a_n,b_n)$  of nonnegative integer pairs with  $a_1 \geq \cdots \geq a_n$  is digraphic if and only if  $\sum^n a_i = \sum^n b_i$  and  $\sum_{i=1}^k a_i \leq \sum_{i=1}^k \min(b_i,k-1) + \sum_{i=k+1}^n \min(b_i,k) \text{ holds for every } 1 \leq k \leq n.$ 

- Möbius inversion formula
  - $f(n) = \sum_{d|n} g(d) \Leftrightarrow g(n) = \sum_{d|n} \mu(d) f(\frac{n}{d})$   $f(n) = \sum_{n|d} g(d) \Leftrightarrow g(n) = \sum_{n|d} \mu(\frac{d}{n}) f(d)$
- Spherical cap

  - A portion of a sphere cut off by a plane. r: sphere radius, a: radius of the base of the cap, h: height of the cap,  $\theta$ :  $\arcsin(a/r)$ . Volume  $= \pi h^2(3r-h)/3 = \pi h(3a^2+h^2)/6 = \pi r^3(2+\cos\theta)(1-\cos\theta)^2/3$ . Area  $= 2\pi rh \pi/(2^2+h^2)$
  - Area  $= 2\pi rh = \pi(a^2 + h^2) = 2\pi r^2(1 \cos\theta)$ .
- Chinese Remainder Theorem
  - $x \equiv a_i \pmod{m_i}$
  - $M = \prod m_i, M_i = M/m_i$
  - $t_i M_i \equiv 1 \pmod{m_i}$
  - $x = \sum a_i t_i M_i \pmod{M}$

           [3]);
      for (auto j : Q[i]) ans[j[3]] += j[2] * root.
           query(j[0], j[1], i);
  }
};
```

#### 9.9 Matroid Intersection

Start from  $S=\emptyset$ . In each iteration, let

```
• Y_1 = \{x \notin S \mid S \cup \{x\} \in I_1\}
• Y_2 = \{x \notin S \mid S \cup \{x\} \in I_2\}
```

If there exists  $x\in Y_1\cap Y_2$  , insert x into S. Otherwise for each  $x\in S, y\not\in S$  , create edges

```
• x \rightarrow y if S - \{x\} \cup \{y\} \in I_1.
• y \rightarrow x if S - \{x\} \cup \{y\} \in I_2.
```

Find a shortest path (with BFS) starting from a vertex in  $Y_1$  and ending at a vertex in  $Y_2$  which doesn't pass through any other vertices in  $Y_2$ , and alternate the path. The size of S will be incremented by 1 in each iteration. For the weighted case, assign weight w(x) to vertex x if  $x \in S$  and -w(x) if  $x \not\in S$ . Find the path with the minimum number of edges among all minimum length paths and alternate it.
