#### 3.10 Flow Model

lower bounds.

- Maximum/Minimum flow with lower bound / Circulation problem
  - 1. Construct super source S and sink T.
  - 2. For each edge (x,y,l,u), connect  $x\to y$  with capacity u-l. 3. For each vertex v, denote by in(v) the difference between the sum of incoming lower bounds and the sum of outgoing
  - 4. If in(v)>0, connect  $S\to v$  with capacity in(v), otherwise, connect  $v\to T$  with capacity -in(v).
    - To maximize, connect t o s with capacity  $\infty$  (skip this in circulation problem), and let f be the maximum flow from S to T. If  $f \neq \sum_{v \in V, in(v) > 0} in(v)$ , there's no solution. Otherwise, the maximum flow from s to t is
    - To minimize, let f be the maximum flow from S to T. Connect  $t \to s$  with capacity  $\infty$  and let the flow from S to T be f'. If  $f+f' \neq \sum_{v \in V, in(v)>0} in(v)$ , there's no solution. Otherwise,  $f^\prime$  is the answer.
  - 5. The solution of each edge e is  $l_e+f_e$ , where  $f_e$  corresponds to the flow of edge e on the graph.
- ullet Construct minimum vertex cover from maximum matching M on bipar- ${\rm tite\ graph\ }(X,Y)$ 
  - 1. Redirect every edge:  $y \to x$  if  $(x,y) \in M$ ,  $x \to y$  otherwise.

  - 2. DFS from unmatched vertices in X. 3.  $x \in X$  is chosen iff x is unvisited. 4.  $y \in Y$  is chosen iff y is visited.
- Minimum cost cyclic flow
  - 1. Consruct super source  ${\cal S}$  and sink  ${\cal T}$
  - 2. For each edge (x,y,c), connect  $x \to y$  with (cost,cap) = (c,1)if c>0, otherwise connect  $y\to x$  with (cost,cap)=(-c,1)
  - 3. For each edge with c<0, sum these cost as K, then increase d(y) by 1, decrease d(x) by 1
    4. For each vertex v with d(v)>0, connect  $S\to v$  with
  - (cost, cap) = (0, d(v))
  - 5. For each vertex v with d(v) < 0, connect v o T with
  - $(\cos t, cap) = (0, -d(v))$  6. Flow from S to T , the answer is the cost of the flow C+K
- Maximum density induced subgraph

  - 1. Binary search on answer, suppose we're checking answer  ${\cal T}$  2. Construct a max flow model, let K be the sum of all weights
  - 3. Connect source  $s \to v$  ,  $v \in G$  with capacity K
  - 4. For each edge (u,v,w) in G, connect  $u \to v$  and  $v \to u$  with capacity w
  - 5. For  $v\in G$ , connect it with sink  $v\to t$  with capacity  $K+2T-(\sum_{e\in E(v)}w(e))-2w(v)$
  - 6. T is a valid answer if the maximum flow f < K |V|
- Minimum weight edge cover
  - 1. Change the weight of each edge to  $\mu(u) + \mu(v) w(u,v)$  , where  $\mu(v)$  is the cost of the cheapest edge incident to v.
  - 2. Let the maximum weight matching of the graph be x, the answer will be  $\sum \mu(v) - x$ .

#### 6.13 Linear Programming Construction

Standard form: maximize  $\mathbf{c}^T\mathbf{x}$  subject to  $A\mathbf{x} \leq \mathbf{b}$  and  $\mathbf{x} \geq 0$ . Dual LP: minimize  $\mathbf{b}^T\mathbf{y}$  subject to  $A^T\mathbf{y} \geq \mathbf{c}$  and  $\mathbf{y} \geq 0$ .  $\bar{\mathbf{x}}$  and  $\bar{\mathbf{y}}$  are optimal if and only if for all  $i \in [1,n]$ , either  $\bar{x}_i = 0$  or  $\sum_{j=1}^m A_{ji}\bar{y}_j = c_i$  holds and for all  $i \in [1,m]$  either  $\bar{y}_i = 0$  or  $\sum_{j=1}^n A_{ij}\bar{x}_j = b_j$  holds.

- 1. In case of minimization, let  $c_i^\prime = -c_i$
- 2.  $\sum_{1 \le i \le n} A_{ji} x_i \ge b_j \to \sum_{1 \le i \le n} -A_{ji} x_i \le -b_j$
- 3.  $\sum_{1 \le i \le n} A_{ji} x_i = b_j$ 
  - $\sum_{1 \le i \le n} A_{ji} x_i \le b_j$   $\sum_{1 \le i \le n} A_{ji} x_i \ge b_j$
- 4. If  $x_i$  has no lower bound, replace  $x_i$  with  $x_i x_i'$

#### 6.14 Theorem

Kirchhoff's Theorem

Denote L be a  $n\times n$  matrix as the Laplacian matrix of graph G, where  $L_{ii}=d(i)$ ,  $L_{ij}=-c$  where c is the number of edge (i,j) in G.

- The number of undirected spanning in G is  $|\mathsf{det}(\tilde{L}_{11})|$  .
- The number of directed spanning tree rooted at r in G is  $|\det(\tilde{L}_{rr})|$ .
- Tutte's Matrix

Let D be a  $n \times n$  matrix, where  $d_{ij} = x_{ij}$  ( $x_{ij}$  is chosen uniformly at random) if i < j and  $(i,j) \in E$ , otherwise  $d_{ij} = -d_{ji}$ .  $\frac{rank(D)}{2}$  is the maximum matching on G.

• Erdős-Gallai Theorem

A sequence of non-negative integers  $d_1 \geq d_2 \geq \ldots \geq d_n$  can be represented as the degree sequence of a finite simple graph on n vertices if and only if  $d_1+d_2+\ldots+d_n$  is even and

$$\sum_{i=1}^k d_i \leq k(k-1) + \sum_{i=k+1}^n \min(d_i,k)$$

holds for all  $1 \leq k \leq n$  .

• Burnside's Lemma

Let X be a set and G be a group that acts on X. For  $g\in G$ , denote by  $X^g$  the elements fixed by g:

$$X^g = \{x \in X \mid gx \in X\}$$

Then

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|.$$

• Gale-Ryser theorem

A pair of sequences of nonnegative integers  $a_1\geq\cdots\geq a_n$  and  $b_1,\ldots,b_n$  is bigraphic if and only if  $\sum_{i=1}^n a_i=\sum_{i=1}^n b_i$  and  $\sum_{i=1}^k a_i\leq a_i$ 

 $\sum_{i=1} \min(b_i,k) \text{ holds for every } 1 \leq k \leq n. \text{ Sequences } a \text{ and } b \text{ called bigraphic if there is a labeled simple bipartite graph such that } a \text{ and } b \text{ is the degree sequence of this bipartite graph.}$ 

• Fulkerson-Chen-Anstee theorem

A sequence  $(a_1,b_1),\ldots,(a_n,b_n)$  of nonnegative integer pairs with  $a_1 \geq \cdots \geq a_n$  is digraphic if and only if  $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$  and  $\sum_{i=1}^k a_i \leq \sum_{i=1}^k \min(b_i,k-1) + \sum_{i=k+1}^n \min(b_i,k) \text{ holds for every } 1 \leq k \leq n$ Sequences  $\boldsymbol{a}$  and  $\boldsymbol{b}$  called digraphic if there is a labeled simple directed graph such that each vertex  $\boldsymbol{v}_i$  has indegree  $\boldsymbol{a}_i$  and

outdegree  $b_i$ .

For simple polygon, when points are all integer, we have  ${\cal A}\,=\,$  $\#\{\text{lattice points in the interior}\} + \frac{\#\{\text{lattice points on the boundary}\}}{2} - 1$ 

- Spherical cap
  - A portion of a sphere cut off by a plane. r: sphere radius, a: radius of the base of the cap, h: height of the cap,  $\theta$ :  $\arcsin(a/r)$ .  $\operatorname{Volume} = \pi h^2(3r-h)/3 = \pi h(3a^2+h^2)/6 = \pi r^3(2+\cos\theta)(1-\cos\theta)^2/3$ .  $\operatorname{Area} = 2\pi r h = \pi(a^2+h^2) = 2\pi r^2(1-\cos\theta)$ .

    else x -> p = Div(y -> b - x -> b, x -> a - y -> a);
    return x->p >= y->p;
  void addline(ll a, ll b) { // ax + b
```

#### 9.8 Min Plus Convolution [b34de3]

```
// a is convex a[i+1]-a[i] <= a[i+2]-a[i+1]
vector<int> min_plus_convolution(vector<int> &a, vector
    <int> &b) {
  int n = a.size(), m = b.size();
  vector < int > c(n + m - 1, INF);
  auto dc = [&](auto Y, int 1, int r, int jl, int jr) {
    if (1 > r) return;
    int mid = (1 + r) / 2, from = -1, &best = c[mid];
    for (int j = jl; j <= jr; ++j)</pre>
      if (int i = mid - j; i >= 0 && i < n)</pre>
        if (best > a[i] + b[j])
          best = a[i] + b[j], from = j;
    Y(Y, 1, mid - 1, jl, from);
   Y(Y, mid + 1, r, from, jr);
 }:
  return dc(dc, 0, n - 1 + m - 1, 0, m - 1), c;
```

#### 9.9 Matroid Intersection

Start from  $S=\emptyset$ . In each iteration, let

```
• Y_1 = \{x \not\in S \mid S \cup \{x\} \in I_1\}
• Y_2 = \{x \not\in S \mid S \cup \{x\} \in I_2\}
```

If there exists  $x \in Y_1 \cap Y_2$ , insert x into S. Otherwise for each  $x \in S, y \not \in S$ , create edges

```
 \begin{array}{l} \bullet \ x \rightarrow y \ \text{if} \ S - \{x\} \cup \{y\} \in I_1 \text{.} \\ \bullet \ y \rightarrow x \ \text{if} \ S - \{x\} \cup \{y\} \in I_2 \text{.} \\ \end{array}
```

Find a shortest path (with BFS) starting from a vertex in  $Y_1$  and ending at a vertex in  $Y_2$  which doesn't pass through any other vertices in  $Y_2$ , and alternate the path. The size of S will be incremented by 1 in each iteration. For the weighted case, assign weight w(x) to vertex x if  $x \in S$  and -w(x) if  $x \not\in S$ . Find the path with the minimum number of edges among all minimum length paths and alternate it.

#### **9.10 Simulated Annealing**

#### 9.11 Bitset LCS

```
cin >> n >> m;
for (int i = 1, x; i <= n; ++i)
   cin >> x, p[x].set(i);
for (int i = 1, x; i <= m; i++) {
   cin >> x, (g = f) |= p[x];
   f.shiftLeftByOne(), f.set(0);
   ((f = g - f) ^= g) &= g;
}
cout << f.count() << '\n';</pre>
```

#### 9.12 Binary Search On Fraction [765c5a]

```
struct Q {
    11 p, q;
    Q go(Q b, ll d) { return {p + b.p*d, q + b.q*d}; }
