```

3.8 Flow Model

- Maximum/Minimum flow with lower bound / Circulation problem

 - 1. Construct super source S and sink T. 2. For each edge (x,y,l,u), connect $x\to y$ with capacity u-l. 3. For each vertex v, denote by in(v) the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
 - 4. If in(v)>0, connect $S\to v$ with capacity in(v), otherwise, connect $v \to T$ with capacity -in(v).
 - To maximize, connect $t \to s$ with capacity ∞ (skip this in circulation problem), and let f be the maximum flow from S to T. If $f \neq \sum_{v \in V, in(v) > 0} in(v)$, there's no solution. Otherwise, the maximum flow from s to t is the answer.
 - To minimize, let f be the maximum flow from S to TConnect $t \to s$ with capacity ∞ and let the flow from S to T be f'. If $f+f' \neq \sum_{v \in V, in(v)>0} in(v)$, there's no solution. Otherwise, f' is the answer.
 - 5. The solution of each edge $\stackrel{.}{e}$ is l_e+f_e , where f_e corresponds to the flow of edge e on the graph.
- \bullet Construct minimum vertex cover from maximum matching M on bipartite graph (X, Y)
 - the graph (x,Y)1. Redirect every edge: $y \to x$ if $(x,y) \in M$, $x \to y$ otherwise. 2. DFS from unmatched vertices in X. 3. $x \in X$ is chosen iff x is unvisited. 4. $y \in Y$ is chosen iff y is visited.
- Maximum density induced subgraph

 - 1. Binary search on answer, suppose we're checking answer T2. Construct a max flow model, let K be the sum of all weights 3. Connect source $s \to v$, $v \in G$ with capacity K4. For each edge (u,v,w) in G, connect $u \to v$ and $v \to u$ with
 - capacity w5. For $v \in G$, connect it with sink $v \to t$ with capacity $K + 2T (\sum_{e \in E(v)} w(e)) 2w(v)$ 6. T is a valid answer if the maximum flow f < K|V|
- Minimum weight edge cover 1. For each $v \in V$ create a copy v', and connect $u' \to v'$ with $extbf{4.3}$ Edge BCC weight w(u,v). 2. Connect v o v' with weight $2\mu(v)$, where $\mu(v)$ is the cost of

 - the cheapest edge incident to v. 3. Find the minimum weight perfect matching on G^\prime .
- Project selection problem
 - I. If $p_v>0$, create edge (s,v) with capacity p_v ; otherwise, create edge (v,t) with capacity $-p_v$.

 2. Create edge (u,v) with capacity w with w being the cost of

 - choosing u without choosing v. 3. The mincut is equivalent to the maximum profit of a subset of projects.
- 0/1 quadratic programming $\sum_x c_x x + \sum_y c_y \bar{y} + \sum_{xy} c_{xy} x \bar{y} + \sum_{xyx'y'} c_{xyx'y'} (x\bar{y} + x'\bar{y'})$

can be minimized by the mincut of the following graph:

- 1. Create edge $\left(x,t\right)$ with capacity c_{x} and create edge $\left(s,y\right)$ with capacity c_y . Create edge (x,y) with capacity c_{xy} . Create edge (x,y) and edge (x',y') with capacity $c_{xyx'y'}$.

Linear Programming Construction

Standard form: maximize $\mathbf{c}^T \mathbf{x}$ subject to $A\mathbf{x} \leq \mathbf{b}$ and $\mathbf{x} \geq 0$. Dual LP: minimize $\mathbf{b}^T\mathbf{y}$ subject to $A^T\mathbf{y} \geq \mathbf{c}$ and $\mathbf{x} \geq 0$. Dual LP: minimize $\mathbf{b}^T\mathbf{y}$ subject to $A^T\mathbf{y} \geq \mathbf{c}$ and $\mathbf{y} \geq 0$. $\bar{\mathbf{x}}$ and $\bar{\mathbf{y}}$ are optimal if and only if for all $i \in [1,n]$, either $\bar{x}_i = 0$ or $\sum_{j=1}^m A_{ji}\bar{y}_j = c_i$ holds and for all $i \in [1,m]$ either $\bar{y}_i = 0$ or $\sum_{j=1}^n A_{ij}\bar{x}_j = b_j$ holds.

- 1. In case of minimization, let $c_i'=-c_i$ 2. $\sum_{1\leq i\leq n}A_{ji}x_i\geq b_j\to \sum_{1\leq i\leq n}-A_{ji}x_i\leq -b_j$
- $\sum_{1 \le i \le n}^{-} A_{ji} x_i = b_j$
 - $\begin{array}{ll} \bullet & \sum_{1 \leq i \leq n} A_{ji} x_i \leq b_j \\ \bullet & \sum_{1 \leq i \leq n} A_{ji} x_i \geq b_j \end{array}$
- 4. If x_i has no lower bound, replace x_i with $x_i x_i'$

6.11 Euclidean

- $m = \lfloor \frac{an+b}{c} \rfloor$
- Time complexity: $O(\log n)$

6.12 Theorem

• Kirchhoff's Theorem

Denote L be a n imes n matrix as the Laplacian matrix of graph G, where $L_{ii}=d(i)$, $L_{ij}=-c$ where c is the number of edge (i,j) in

- The number of undirected spanning in G is $|\det(\tilde{L}_{11})|$.
- The number of directed spanning tree rooted at r in G is $|\det(\tilde{L}_{rr})|$.
- Tutte's Matrix

Let D be a n imes n matrix, where $d_{ij} = x_{ij}$ (x_{ij} is chosen uniformly at random) if i < j and $(i,j) \in E$, otherwise $d_{ij} = -d_{ji}$. $\frac{rank(D)}{2}$ is the maximum matching on ${\cal G}.$

- Cayley's Formula
 - Given a degree sequence d_1, d_2, \ldots, d_n for each labeled vertices, there are

$$\frac{(n-2)!}{(d_1-1)!(d_2-1)!\cdots(d_n-1)!}$$

spanning trees.

- Let $T_{n,k}$ be the number of *Labeled* forests on n vertices with k components, such that vertex $1,2,\ldots,k$ belong to different components. Then $T_{n,k}=kn^{n-k-1}$.
- Erdős-Gallai Theorem

A sequence of non-negative integers $d_1 \geq d_2 \geq \ldots \geq d_n$ can be represented as the degree sequence of a finite simple graph on nvertices if and only if $d_1 + d_2 + \ldots + d_n$ is even and

$$\sum_{i=1}^k d_i \le k(k-1) + \sum_{i=k+1}^n \min(d_i, k)$$

holds for all $1 \leq k \leq n$.

• Burnside's Lemma

Let X be a set and G be a group that acts on X . For $g\in G$, denote by X^g the elements fixed by g :

$$X^g = \{x \in X \mid gx \in X\}$$

Then

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|.$$

Gale-Ryser theorem

A pair of sequences of nonnegative integers $a_1 \geq \cdots \geq a_n$ and b_1,\dots,b_n is bigraphic if and only if $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$ and $\sum_{i=1}^k a_i \leq a_i$

 $\sum_{i=1}^{n} \min(b_i, k)$ holds for every $1 \leq k \leq n$

• Fulkerson-Chen-Anstee theorem

A sequence $(a_1,b_1),\ldots,(a_n,b_n)$ of nonnegative integer pairs with $a_1 \geq \cdots \geq a_n$ is digraphic if and only if $\sum^n a_i = \sum^n b_i$ and $\sum_{i=1}^k a_i \leq \sum_{i=1}^k \min(b_i,k-1) + \sum_{i=k+1}^n \min(b_i,k) \text{ holds for every } 1 \leq k \leq n.$

- Möbius inversion formula
 - $f(n) = \sum_{d|n} g(d) \Leftrightarrow g(n) = \sum_{d|n} \mu(d) f(\frac{n}{d})$ $f(n) = \sum_{n|d} g(d) \Leftrightarrow g(n) = \sum_{n|d} \mu(\frac{d}{n}) f(d)$
- Spherical cap

 - A portion of a sphere cut off by a plane. r: sphere radius, a: radius of the base of the cap, h: height of the cap, θ : $\arcsin(a/r)$. Volume $= \pi h^2(3r-h)/3 = \pi h(3a^2+h^2)/6 = \pi r^3(2+\cos\theta)(1-\cos^2\theta)$
 - $\cos \theta)^2/3$. Area $= 2\pi r h = \pi(a^2 + h^2) = 2\pi r^2(1 \cos \theta)$.
- Chinese Remainder Theorem
 - $x \equiv a_i \pmod{m_i}$
 - $M = \prod m_i, M_i = M/m_i$
 - $t_i M_i \equiv 1 \pmod{m_i}$
 - $x = \sum a_i t_i M_i \pmod{M}$

           query(j[0], j[1], i);
    }
  }
};
```

9.12 Matroid Intersection

Start from $S=\emptyset$. In each iteration, let

```
• Y_1 = \{x \notin S \mid S \cup \{x\} \in I_1\}
• Y_2 = \{x \notin S \mid S \cup \{x\} \in I_2\}
```

If there exists $x\in Y_1\cap Y_2$, insert x into S. Otherwise for each $x\in S, y\not\in S$, create edges

```
 \begin{array}{l} \bullet \ x \rightarrow y \ \text{if} \ S - \{x\} \cup \{y\} \in I_1. \\ \bullet \ y \rightarrow x \ \text{if} \ S - \{x\} \cup \{y\} \in I_2. \end{array}
```

Find a shortest path (with BFS) starting from a vertex in Y_1 and ending at a vertex in Y_2 which doesn't pass through any other vertices in Y_2 , and alternate the path. The size of S will be incremented by 1 in each iteration. For the weighted case, assign weight w(x) to vertex x if $x \in S$ and -w(x) if $x \not\in S$. Find the path with the minimum number of edges among all minimum length paths and alternate it.
